The quest for π

- The following formula computes 8 correct digits per iteration (Ramanujan):

$$\frac{1}{\pi} = \sum_{n=0}^{\infty} \frac{(\frac{1}{4})_n (\frac{2}{4})_n (\frac{3}{4})_n}{n!^3} \left(2\sqrt{2}(1103 + 26390n)\right) \frac{1}{(99^2)^{2n+1}}$$
