The trig package*

David Carlisle

1999/03/16

1 Introduction

These macros implement the trigonometric functions, sin, cos and tan. In each case two commands are defined. For instance the command \CalculateSin{33} may be isued at some point, and then anywhere later in the document, the command $UseSin{33}$ will return the decimal expansion of $sin(33^\circ)$.

The arguments to these macros do not have to be whole numbers, although in the case of whole numbers, LATFX or plain TFX counters may be used. In TFXBook syntax, arguments must be of type: $\langle optional \ signs \rangle \langle factor \rangle$

Some other examples are:

\CalculateSin{22.5}, \UseTan{\value{mycounter}}, \UseCos{\count0}.

Note that unlike the psfig macros, these save all previously computed values. This could easily be changed, but I thought that in many applications one would want many instances of the same value. (eg rotating all the headings of a table by the *same* amount).

I don't really like this need to pre-calculate the values, I originally implemented \UseSin so that it automatically calculated the value if it was not pre-stored. This worked fine in testing, until I remembered why one needs these values. You want to be able to say \dimen2=\UseSin{30}\dimen0. Which means that \UseSin must expand to a $\langle factor \rangle$.

2 The Macros

 $1 \langle * \mathsf{package} \rangle$

Some useful constants for converting between degrees and radians. \nin@ty

\@clxx \@lxxi

```
\frac{\pi}{180} \simeq \frac{355}{113 \times 180} = \frac{71}{4068}
```

\@mmmmlxviii

2 \chardef\nin@ty=90 3 \chardef\@clxx=180 4 \chardef\@lxxi=71 5 \mathchardef\@mmmlxviii=4068

The approximation to sin. I experimented with various approximations based on Tchebicheff polynomials, and also some approximations from a SIAM handbook 'Computer Approximations' However the standard Taylor series seems sufficiently accurate, and used by far the fewest TFX tokens, as the coefficients are all rational.

$$\sin(x) \simeq x - (1/3!)x^3 + (1/5!)x^5 - (1/7!)x^7 + (1/9!)x^9$$

$$\simeq \frac{((((7!/9!x^2 - 7!/7!)x^2 + 7!/5!)x^2 + 7!/3!)x^2 + 7!/1!)x^7}{7!}$$

$$= \frac{((((1/72x^2 - 1)x^2 + 42)x^2 + 840)x^2 + 5040)x}{5040}$$

*This file has version number v1.09, last revised 1999/03/16.

The nested form used above reduces the number of operations required. In order to further reduce the number of operations, and more importantly reduce the number of tokens used, we can precompute the coefficients. Note that we can not use 9! as the denominator as this would cause overflow of T_EX 's arithmetic.

\@coeffz	Save the coefficients as $(math)chars$.
\@coeffa	6 \chardef\@coeffz=72
\@coeffb	7 %\chardef\@coefa=1
\@coeffc	8 \chardef\@coefb=42
\@coeffd	9 \mathchardef\@coefc=840
	10 \mathchardef\@coefd=5040
\TG@rem@pt	The standard trick of getting a real number out of a $\langle dimen \rangle$. This gives a maximum accuracy of approx. 5 decimal places, which should be sufficient. It puts a space after the number, perhaps it shouldn't. 11 {\catcode`t=12\catcode`p=12\gdef\noPT#1pt{#1}}
	12 \def\TG@rem@pt#1{\expandafter\noPT\the#1\space}
\TG@term	Compute one term of the above nested series. Multiply the previous sum by x^2 (stored in \@tempb, then add the next coefficient, #1. 13 \def\TG@term#1{% 14 \dimen@\@tempb\dimen@ 15 \advance\dimen@ #1\p@}
\TG@series	Compute the above series. the value in degrees will be in \dimen0 before this is called.
	16 \def\TG@series{%
	17 \dimen@\@lxxi\dimen@
	18 \divide \dimen@ \@mmmmlxviii
	\dimen@ now contains the angle in radians, as a $\langle dimen \rangle$. We need to remove the units, so store the same value as a $\langle factor \rangle$ in \@tempa.
	<pre>19 \edef\@tempa{\TG@rem@pt\dimen@}%</pre>
	Now put x^2 in \dimen0 and \Otempb.
	20 \dimen@\@tempa\dimen@
	21 \edef\@tempb{\TG@rem@pt\dimen@}%
	The first coefficient is $1/72$.
	22 \divide\dimen@\@coeffz
	23 \advance\dimen@\m@ne\p@
	24 \TG@term\@coefb
	25 \TG@term{-\@coefc}%
	26 \TG@term\@coefd
	Now the cubic in x^2 is completed, so we need to multiply by x and divide by 7!.
	27 \dimen@\@tempa\dimen@
	28 \divide\dimen@ \@coefd}
\CalculateSin	If this angle has already been computed, do nothing, else store the angle, and call \TG@@sin.
	29 \def\CalculateSin#1{{%
	30 \expandafter\ifx\csname sin(\number#1)\endcsname\relax
	31 \dimen@=#1\p@\TG@@sin
	<pre>32 \expandafter\xdef\csname sin(\number#1)\endcsname</pre>
	33 {\TG@rem@pt\dimen@}%
	34 \fi}}
\CalculateCos	As above, but use the relation $\cos(x) = \sin(90 - x)$. 35 \def\CalculateCos#1{{%
	<pre>35 \def\CalculateCos#1{{% 36 \expandafter\ifx\csname cos(\number#1)\endcsname\relax</pre>
	37 \dimend=\nindty\p0

38 \advance\dimen@-#1\p@

```
\TG@@sin
               39
               40
                      \expandafter\xdef\csname cos(\number#1)\endcsname
                                                         {\TG@rem@pt\dimen@}%
               41
                    fi}
               42
               Repeatedly use one of the relatations \sin(x) = \sin(180 - x) = \sin(-180 - x)
   \TG@reduce
               to get x in the range -90 \le x \le 90. Then call \TG@series.
               43 \def\TG@reduce#1#2{%
               44 \dimen@#1#2\nin@ty\p@
                    \advance\dimen@#2-\@clxx\p@
               45
                    \dimen@-\dimen@
               46
                    TG@@sin
               47
     \TG@@sin Slightly cryptic, but it seems to work...
               48 \det TG@@sin{%
                    \ifdim\TG@reduce>+%
               49
                    \else\ifdim\TG@reduce<-%
               50
                    \else\TG@series\fi\fi}%
               51
      \UseSin Use a pre-computed value.
      \UseCos 52 \def\UseSin#1{\csname sin(\number#1)\endcsname}
               53 \def\UseCos#1{\csname cos(\number#1)\endcsname}
                   A few shortcuts to save space.
               54 \chardef\z@num\z@
               55 \expandafter\let\csname sin(0)\endcsname\z@num
               56 \expandafter\let\csname cos(0)\endcsname\@ne
               57 \expandafter\let\csname sin(90)\endcsname\@ne
               58 \expandafter\let\csname cos(90)\endcsname\z@num
               59 \expandafter\let\csname sin(-90)\endcsname\m@ne
               60 \expandafter\let\csname cos(-90)\endcsname\z@num
               61 \expandafter\let\csname sin(180)\endcsname\z@num
               62 \expandafter\let\csname cos(180)\endcsname\m@ne
\CalculateTan Originally I coded the Taylor series for tan, but it seems to be more accurate to
               just take the ratio of the sine and cosine. This is accurate to 4 decimal places
               for angles up to 50^{\circ}, after that the accuracy tails off, giving 57.47894 instead of
               57.2900 for 89°.
               63 \def\CalculateTan#1{{%
                    \expandafter\ifx\csname tan(\number#1)\endcsname\relax
               64
                      \CalculateSin{#1}%
               65
                      \CalculateCos{#1}%
               66
                      \@tempdima\UseCos{#1}\p@
               67
                      \divide\@tempdima\@iv
